Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, the method comprising:

configuring each of said plurality of ports by a user on said layer 2 switch as a protected port or a non-protected port;

matching a destination address on a data packet with a physical address on said layer 2 switch, said data packet received by an ingress port;

generating a forwarding map for said data packet based upon said destination address on said data packet; and

sending said data packet to said plurality of ports pursuant to said forwarding map.

2. (Original) The method of claim 1 wherein said generating step further comprises sending said data packet to each of said non-protected ports if said destination address is not matched with said physical address and said ingress port is a protected port.

3. (Original) The method of claim 1 wherein said generating step further comprises sending said data packet to all of said plurality of ports if said destination address is not matched with said physical address and said ingress port is a non-protected port.

4. (Original) The method of claim1 wherein said generating step further comprises allowing said data packet to be forwarded from one of said protected ports to each of said non-protected ports.

5. (Original) The method of claim 1 wherein said generating step further comprises allowing said data packet to be forwarded between each of said non-protected ports.

6. (Original) The method of claim 1 wherein said generating step further comprises prohibiting said data packet to be forwarded between each of said protected ports.

7. (Original) The method of claim 1 wherein said generating step further comprises allowing said data packet to be forwarded between one of said non-protected ports to each of said protected ports.

8. (Currently Amended) A program storage device readable by a machine, tangibly embodying a program of instructions executable by the machine to perform a method for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, said method comprising:

configuring each of said plurality of ports by a user on said layer 2 switch as a protected port or a non-protected port;

matching a destination address on a data packet with a physical address on said layer 2 switch, said data packet received by an ingress port;

generating a forwarding map for said data packet based upon said destination address on said data packet; and

sending said data packet to said plurality of ports pursuant to said forwarding map.

9. (Currently Amended) An apparatus for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, the apparatus comprising:

a port configurer to configure said plurality of ports as a protected port or a non-protected port;

an address table memory storing an address table, said address table having a destination address and port number pair;

a forwarding map generator generating a forwarding map; and

said forwarding map responsive to a destination address of a data packet so that the data packet is forwarded either to a port number paired with the destination address in said forwarding table, or if not so paired, said data packet is forwarded to each of said non-protected ports on said switch if an ingress port is protected or if said ingress port is non-protected, said data packet is forwarded to all of said plurality of ports.

10. (Original) The apparatus of claim 9 wherein said incoming packet is forwarded from one of said non-protected ports to other non-protected ports.

11. (Original) The apparatus of claim 9 wherein said data packet is forwarded from one of said protected ports to each of said non-protected ports.

12. (Original) The apparatus of claim 9 wherein said data packet is forwarded from one of said non-protected ports to each of said protected ports.

13. (Currently Amended) An apparatus for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, the apparatus comprising:

means to configure each of said plurality of ports on said layer 2 switch as a protected or non-protected port;

means to match a destination address on a data packet with a physical address on said layer 2 switch, said data packet received on an ingress port;

means to generate a forwarding map for said data packet based upon said destination address on said data packet; and

means to send said data packet to said plurality of ports pursuant to said forwarding map.

14. (Original) The apparatus of claim 13 wherein said means to generate a forwarding map further comprises a means to forward said data packet to each of said non-protected ports if said destination address is not matched with said physical address and said ingress port is a protected port.

15. (Original) The apparatus of claim 13 wherein said means to generate a forwarding map further comprises a means to forward said data packet to all of said plurality of ports if said destination address is not matched with said physical address and said ingress port is a non-protected port.

16. (Original) The apparatus of claim 13 wherein said means to generate a forwarding map further comprises a means to allow said data packet to be forwarded from one of said protected ports to each of said non-protected ports.

17. (Original) The apparatus of claim 13 wherein said means to generate a forwarding map further comprises means to allow said data packet to be forwarded between each of said non-protected ports.

18. (Original) The apparatus of claim 13 wherein said means to generate a forwarding map further comprises prohibiting said data packet to be forwarded between each of said protected ports.

19. (Original) The apparatus of claim 13 wherein said means to generate a forwarding map further comprises allowing said data packet to be forwarded between one of said non-protected ports to each of said protected ports.

20. (Currently Amended) A method for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices

within a local area network, at least one device in the group not belonging to any other VLAN, the method comprising:

maintaining a state for each of said plurality of ports on said layer 2 switch as a protected port or a non-protected port;

matching a destination address on a data packet with a physical address on said layer 2 switch, said data packet received by an ingress port;

generating a forwarding map for said data packet based upon said destination address on said data packet; and

sending said data packet to said plurality of ports pursuant to said forwarding map.

21. (Original) The method of claim 20 wherein said generating step further comprises sending said data packet to each of said non-protected ports if said destination address is not matched with said physical address and said ingress port is a protected port.

22. (Original) The method of claim 20 wherein said generating step further comprises sending said data packet to all of said plurality of ports if said destination address is not matched with said physical address and said ingress port is a non-protected port.

23. (Original) The method of claim 20 wherein said generating step further comprises allowing said data packet to be forwarded from one of said protected ports to each of said non-protected ports.

24. (Original) The method of claim 20 wherein said generating step further comprises allowing said data packet to be forwarded between each of said non-protected ports.

25. (Original) The method of claim 20 wherein said generating step further comprises prohibiting said data packet to be forwarded between each of said protected ports.

26. (Original) The method of claim 20 wherein said generating step further comprises allowing said data packet to be forwarded between one of said non-protected ports to each of said protected ports.

27. (Currently Amended) A program storage device readable by a machine, tangibly embodying a program of instructions executable by the machine to perform a method for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, said method comprising:

maintaining a state for each of said plurality of ports on said layer 2 switch as a protected port or a non-protected port;

matching a destination address on a data packet with a physical address on said layer 2 switch, said data packet received by an ingress port;

generating a forwarding map for said data packet based upon said destination address on said data packet; and

sending said data packet to said plurality of ports pursuant to said forwarding map.

28 (Currently Amended) An apparatus for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, the method comprising:

means for maintaining a state for each of said plurality of ports on said layer 2 switch as a protected port or a non-protected port;

means for matching a destination address on a data packet with a physical address on said layer 2 switch, said data packet received by an ingress port;

means for generating a forwarding map for said data packet based upon said destination address on said data packet; and

means for sending said data packet to said plurality of ports pursuant to said forwarding map.

29. (Previously Presented) The apparatus of claim 28 wherein said means for generating further comprises means for sending said data packet to each of said non-protected ports if said destination address is not matched with said physical address and said ingress port is a protected port.

30. (Previously Presented) The apparatus of claim 28 wherein said means for generating further comprises means for sending said data packet to all of said plurality of ports if said destination address is not matched with said physical address and said ingress port is a non-protected port.

31. (Previously Presented) The apparatus of claim 28 wherein said means for generating further comprises means for allowing said data packet to be forwarded from one of said protected ports to each of said non-protected ports.

32. (Previously Presented) The apparatus of claim 28 wherein said means for generating further comprises means for allowing said data packet to be forwarded between each of said non-protected ports.

33. (Previously Presented) The apparatus of claim 28 wherein said means for generating further comprises means for prohibiting said data packet to be forwarded between each of said protected ports.

34. (Previously Presented) The apparatus of claim 28 wherein said means for generating further comprises means for allowing said data packet to be forwarded between one of said non-protected ports to each of said protected ports.

35. (Currently Amended) An apparatus for isolating a plurality of ports sharing a single virtual local area network (VLAN) on a layer 2 switch, wherein the single VLAN is a group of devices within a local area network, at least one device in the group not belonging to any other VLAN, the apparatus comprising:

a state maintenance module configured to maintain a state for each of said plurality of ports on said layer 2 switch as a protected port or a non-protected port;

a destination address matching module coupled to said state maintenance module and configured to match a destination address on a data packet with a physical address on said layer 2 switch, said data packet received by an ingress port;

a forwarding map generator coupled to said destination address matching module; and

a data packet sending module coupled to said forwarding map generator and configured to send said data packet to said plurality of ports pursuant to said forwarding map.

36. (Previously Presented) The apparatus of claim 35 wherein said forwarding map generator is configured to send said data packet to each of said non-protected ports if said destination address is not matched with said physical address and said ingress port is a protected port.

37. (Previously Presented) The apparatus of claim 35 wherein said forwarding map generator is configured to send said data packet to all of said plurality of ports if said destination address is not matched with said physical address and said ingress port is a non-protected port.

38. (Previously Presented) The apparatus of claim 35 wherein said forwarding map generator is further configured to allow said data packet to be forwarded from one of said protected ports to each of said non-protected ports.

39. (Previously Presented) The apparatus of claim 35 wherein said forwarding map generator is further configured to allow said data packet to be forwarded between each of said non-protected ports.

40. (Previously Presented) The apparatus of claim 35 wherein said forwarding map generator is further configured to prohibit said data packet to be forwarded between each of said protected ports.

41. (Previously Presented) The apparatus of claim 35 wherein said forwarding map generator is further configured to allow said data packet to be forwarded between one of said non-protected ports to each of said protected ports.
